SUMMARY

Full Stack Software Engineer with experience building backend services, data pipelines, and frontend interfaces across the full stack. At Alstonair, I work on a real estate platform where I own features end-to-end — from designing database schemas and writing FastAPI services to shipping complex React components. I care about writing code that is straightforward to read and easy to change.

EDUCATION

- GITAM University** Bengaluru, India
• *B.Tech in Computer Science Engineering | CGPA: 7.2/10.0* 2022 – 2025
 - **Relevant Coursework:** Data Structures & Algorithms, Database Management Systems, Operating Systems, Computer Networks, Object-Oriented Programming

EXPERIENCE

- Alstonair Technologies** Bengaluru, India
• *Full Stack Software Engineer* Apr 2026 – Present
 - **Full Stack Development:** Work across the full stack on a real estate platform — building and maintaining React/TypeScript frontend components, Python FastAPI services, and PostgreSQL schemas. On the frontend, I work on property detail pages, interactive SVG map visualisations, and data-rich UI components. On the backend, I write database schemas, handle migrations, manage large property datasets, and debug validation issues between Pydantic models and PostgreSQL constraints. I also contribute to product decisions around how features are presented to users.
- GITAM University** Bengaluru, India
• *Field Assistant – IoT Research* Sep 2025 – Mar 2026
 - **DST-Funded IoT Research Project:** Worked on a government-funded project using IoT sensors to help rural silk farmers monitor environmental conditions. Set up sensors, wired them into ThingzMate for data logging, and built supporting software around the data pipeline. Ran a two-day workshop in Kannada and English for 40+ farmers with no prior technical background.
- Himalaya Wellness Company** Bengaluru, India
• *Software Developer Intern* Jan 2025 – Feb 2025
 - **Geolocation-Based QR System:** Built a QR code system that redirected users to different pages based on their location, used across 3 active marketing campaigns by the end of the internship. Wrote the backend in .NET with SQL Server, handling the location detection logic and redirect routing.

TECHNICAL SKILLS

- **Languages:** Java, Python, JavaScript, TypeScript, SQL, Kotlin
- **Backend:** Spring Boot, FastAPI, Django, Node.js, Express.js, Flask, Micronaut
- **Frontend:** React, Next.js, HTML5, CSS3, Tailwind CSS
- **Databases:** PostgreSQL, MySQL, Redis, Supabase, SQL Server
- **Messaging & Events:** Apache Kafka, Redis Pub/Sub, WebSockets, Dead Letter Queue
- **Cloud & DevOps:** Docker, GitHub Actions, Azure, Git, Postman, Linux/Unix
- **Concepts:** REST APIs, Event-Driven Architecture, Microservices, Distributed Systems, JWT, RBAC, CI/CD, Agile/Scrum

PROJECTS

- **Real-Time Order Tracking System |** May 2026
Python, FastAPI, Apache Kafka, PostgreSQL, Redis, React, Docker
Built a multi-service system where an order moves through stages: created, picked up by the warehouse, paid, and tracked. Each service communicates through Kafka topics and has no direct knowledge of the others. Set up a dead letter queue so failed payments retry up to 3 times before landing there instead of disappearing silently. Used Redis to cache order state so frequent reads don't hit the database, and WebSockets to push live updates to the browser without polling. Everything runs in Docker Compose with health checks so services wait for their dependencies before starting.

- Inventory Event Processor** | *Java, Spring Boot, PostgreSQL, React* May 2026
 A Spring Boot service that receives inventory update events, processes them asynchronously, and writes results to PostgreSQL with a full audit log of every change. Built a small React dashboard on top to monitor changes in near real-time. First end-to-end project in Java — helped me get comfortable with Spring’s request lifecycle and how it handles async work.
- Personal Portfolio Website** | *Next.js, TypeScript, Tailwind CSS, Groq API, EmailJS, Vercel* May 2026
 Full-stack portfolio site with an AI chatbot powered by Groq API, EmailJS contact form, custom domain via Namecheap, and CI/CD deployment on Vercel through GitHub.
- GitPilot – AI-Powered GitHub CLI Tool** | *Python, Ollama, GitHub API, PyPI* Mar 2026
 A CLI tool published to PyPI that uses a local LLM (via Ollama) to generate commit messages and README files from your code changes, no API key or cost involved. Built it to stop writing the same kinds of commit messages by hand. Packaged with pyproject.toml so anyone can install it with pip.
- Secure Form-Based Data Collection System** | *Next.js, TypeScript, Node.js, Express, PostgreSQL* Jul 2025 – Mar 2026
 A platform for collecting and managing community data with separate access levels for admins and regular users. Handled auth with Supabase, wrote JWT verification middleware in Express, and built an admin dashboard with search, filters, pagination, and CSV export. The schema manages 15+ fields per record across multiple user roles.
